2	Release History	6

1 About This Release

This release of PACE Suite includes:

- Support for PSADT v4
For details, see section 1.1
- Code Snippets in PSADT
For details, see section 1.2
- VBS deprecation
For details, see section 1.3
- Improvements and Fixes
For details, see section 1.4

1.1 Support for PSADT v4

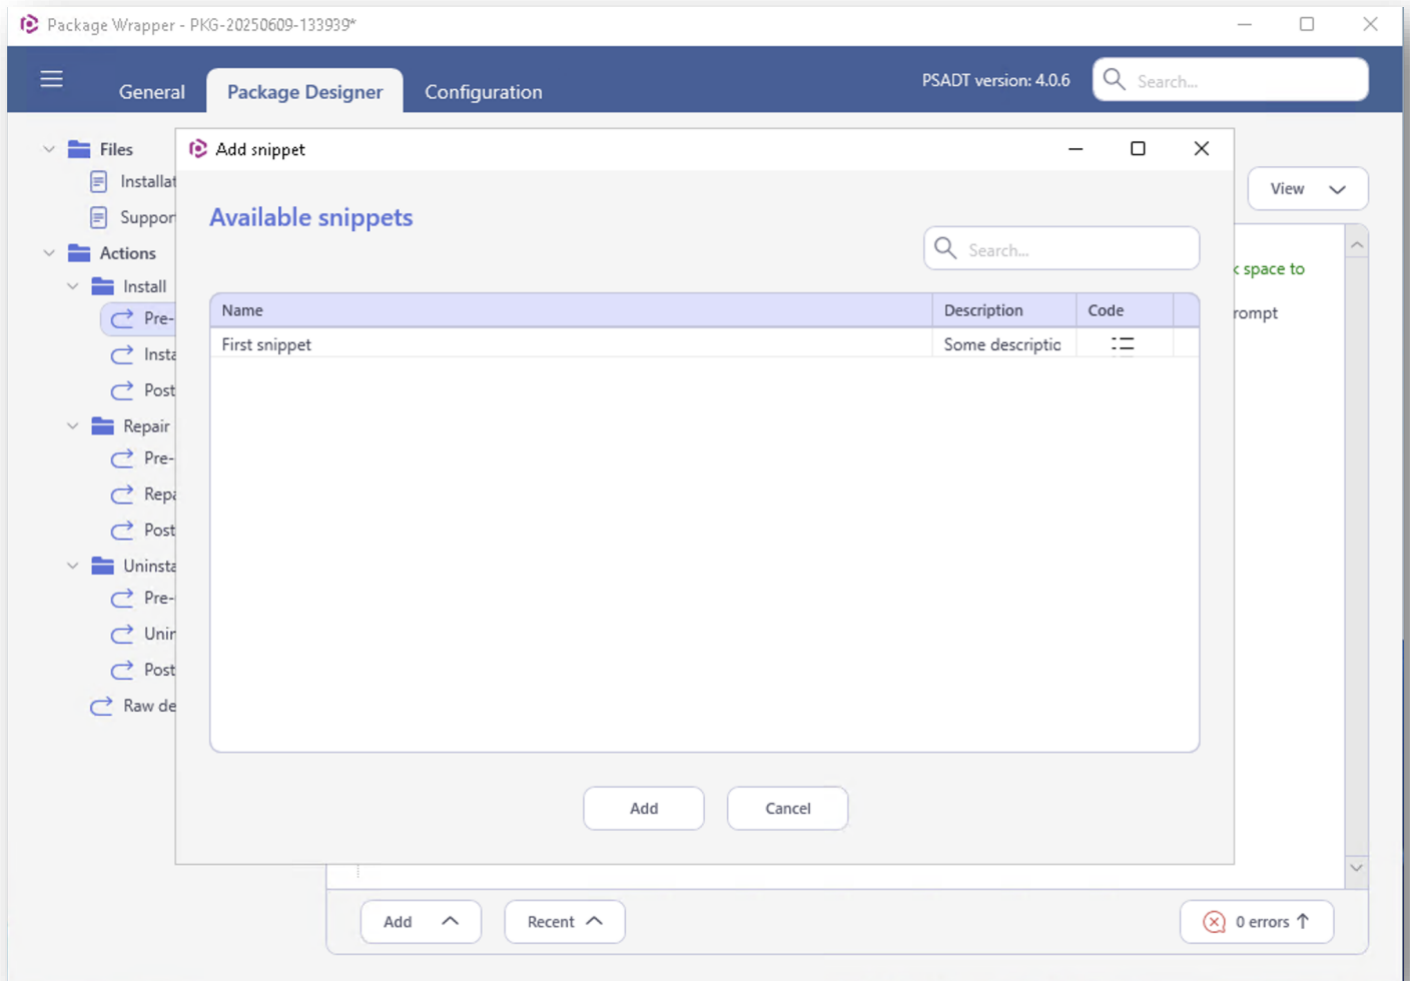

We have added support for the newest v4 of the very popular PSAppDeployToolkit framework. This version brought many dramatic changes, including changes to commands, variables, and the package's file structure. Find the complete list of changes in comparison to v3 at

<https://psappdeploytoolkit.com/docs/getting-started/changes-in-v4>

How to Get Started: (1) run **PACE Suite Launcher**; (2) select 'Packager Tasks > Create Package > PSAppDeployToolkit'.

1.2 Code Snippets in PSADT

Code snippets are small blocks of reusable code. Save your frequently used code as a snippet and insert it where and as many times as needed. You can use code snippets to save any piece of code of any size.

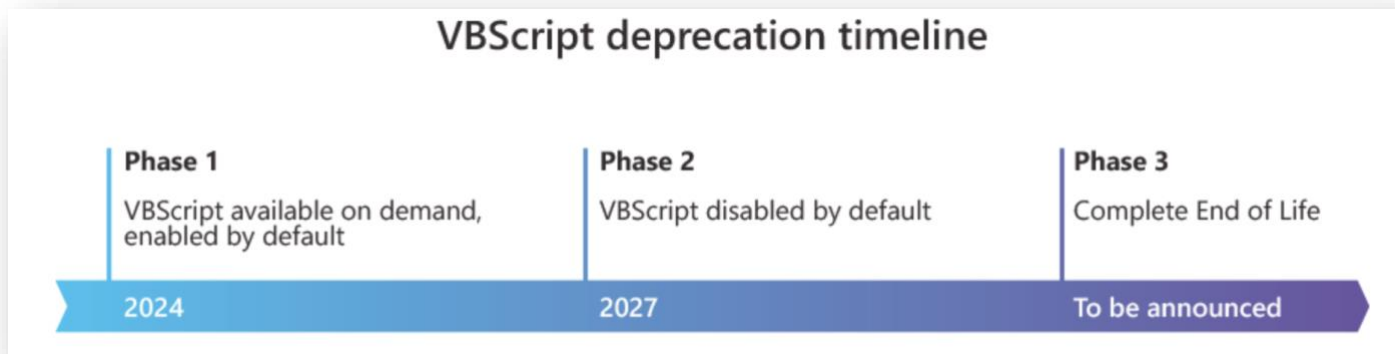

You can configure Package Wrapper to use either your personal or your team's code snippets.

How to Get Started: (1) open the PSADT project in **Package Wrapper**; (2) navigate to 'Package Designer > Actions > (select required action section)'; (3) click Add > Snippet.

To save a code block to snippet, select a code and then select 'Save to snippet' from the context menu.

To configure a saving location, edit or delete snippets, go to Menu > Settings > Snippets.

1.3 VBS deprecation

Added not only a validator that automatically checks if the opened MSI package contains Custom Actions with VBScript but also replaced all our VBS wrappers for silent invoke of executables such as secedit.exe for permissions propagation and others.

1.4 Improvements and Fixes

- Fixed the issue when the Package ID section in Package Generator is disabled, which prevents building MSI.
- Fixed sporadic crashes on building MSI in Package Generator.
- Fixed unintentional file opening when extracting COM information during the file import.
- Fixed the issue when newly added folders are missing from the INSTALLDIR field in Package Generator.
- Fixed the issue where changing INSTALLDIR in the installation wizard did not actually affect the installation path.
- Fixed the problem when changes to permission settings were not applied to MSI correctly.
- Fixed several other minor and UI bugs.
